Date 22 Jan. 45, 1945

Plain film shows faintly outline renal shadows which are normal in size, shape and position. There is a supra-pubic drainage tube in situ films 5, 15, 30 and 45 min. after I.V. Diodrast shows a normal left upper urinary tract. There is a faint concentration of contrast substance in the calices of the right kidney at 15, 30, and 45 min. The architecture is not well visualized but the calices are dilated and irregular in outline.

There are features of the kind of the tumor and pulse
 of both sides with deformity.
 Impression: Negative left upper urinary tract.
 2. Obstruction right ureter, with right hydro-
 nephrosis and probably infected right kidney.
 3. Deformity of right side of kidney which appears
 largely intrinsic, but there may also be an external
 pressure defect.

15 Mar 45 This man was admitted 13 Dec 44 after
 being hit by a truck. He had a laceration
 of the bladder which was sutured and a supra-
 pubic cystostomy done. Suprapubic healed, was
 giving some urine by urethra. Attempts
 to catheterize urethra unsuccessful. Began
 to have fever again & pain in rt kidney
 region. Rt nephrectomy done. He had
 relatively uneventful recovery -
 discharged today
