Wentworth Hospital,
Fort Mills, P.T.

999-3-31
May 16, 1942.

Subject: Explanation of the Medical Services in general.

To: Colonel S. Horiguchi, Director of the Medical Department of
Japanese Occupying Army.

1. Organization and duties of the Medical Department, U.S. Army.

a. The Medical Department of the United States Army consists of the following component organizational parts:

- (1). The Surgeon General, a Major General.
- (2). Four Assistant Surgeons General, Brigadier Generals.
- (3). The Medical Corps, Commissioned Medical Officers.
- (4). The Dental Corps, Commissioned Dental Surgeons.
- (5). The Veterinary Corps, Commissioned graduates in Veterinary medicine.
- (6). The Medical Administrative Corps, commissioned administrative medical experts.
- (7). The Army Nurse Corps, commissioned graduate female nurses.
- (8). Warrant Officers.
- (9). A number of enlisted men.
- (10). Such contract surgeons (Civilian graduates in medicine and surgery) as are authorized by law.

b. The mission of the Medical Department is the preservation of the strength of the military forces; the conservation of man - power.

c. The Medical Department performs the following functions, each of which is organized and administered throughout the Army by a Senior Medical Department Officer in the office of the Surgeon General:

- (1). Conduct of physical examinations prior to entry into the service.
- (2). Practice of Preventive Medicine among military personnel.
- (3). Professional medicine, dental and surgical care of sick and wounded.
- (4). Transportation of sick and wounded.
- (5). Administration of military medical establishments.
- (6). Compilation and evaluation of military medical statistics.
- (7). Selection, classification and training of medical department personnel.
- (8). Operation of a veterinary service to include inspection of meat, meat foods and dairy products required by the Army.
- (9). Procurement, storage, issue and maintenance of medical supplies.
- (10). Research and development in medical department methods and materials.
- (11). Collection and preparation of instructional museum material for medical department.

d. While all of the foregoing functions have their control centered in the office of the Surgeon General, decentralization is accomplished in that an officer of the medical corps, usually having the rank of Colonel, is appointed to be surgeon for and to organize the next downward echelon for entirely similar functions for each of the geographical areas of the United States and its possessions into which the country is divided for military purposes; these areas are known as "Corps Areas" and the senior surgeon of a corps area is known as the Corps Area Surgeon. In time of war senior medical officers serve under the Surgeon General as Army, Force and Area Surgeons. The continental United States is divided into four Army Zones and nine corps areas, each of which has its surgeon with his special staff; Under each such area surgeon are the medical department installations and personnel pertaining to the tactical and service element of each such area, (e.g. Corps, division, brigade, regimental, battalion surgeons and installations for tactical units and station, surgical, convalescent and general hospitals and medical supply depots for service commands).

e. Certain general hospitals, dispensaries, laboratories and museums remain directly under control of the Surgeon General, not being subject to command of Army or Corps Area tactical commanders.

f. Each tactical unit of the army has its integral medical department components, who move with it and serve its medical needs; organization of these units will be as given in the following item number 3.

g. Surgeons of the several tactical units have in general two functions - 1st: Advisory function to line commanders in the relationship of staff officers and - 2nd: an administrative function in the conduct of the medical department as a technical service.

h. To serve with tactical units of the air arm, medical department officers are given special training in the specialty of aviation medicine and designated Flight Surgeons but aside from such special professional qualification they bear the same relationship to higher and lower echelons of medical service as do surgeons attached to other arms and services.

i. The plan for evacuation and care of an infantry soldier wounded or sick in combat is in general as follows:

He is given first aid by the company aid man (Enlisted man) with his company; litter bearers from his battalion or regimental medical detachment escort or carry him to the battalion or regimental aid station where a medical officer renders skilled first aid to include administration of morphine, control of hemorrhage and necessary splinting. Then litter bearers from the collecting company of the medical regiment carry him to the collecting station where more deliberate surgical treatment is available and where he may be redressed and re-splinted and fed. Clearing companies then transport him over the road net in ambulances to the clearing station where still more elaborate hospital care is available though this is restricted by the fact that the clearing station must remain mobile.

To go farther to the rear Corps or Army ambulances or train units transfer him appropriately either to a surgical, evacuation, convalescent or general hospital in the zone of communication or of the zone of the interior.

From any medical point along the route the casualty may be returned to duty if he recovers.

3. Organization and Duties of the Medical Department, U.S. Navy.

- (1). Chief of the Bureau of Medicine and Surgery. (Surgeon General).
 Assistant to the Chief of the Bureau of Medicine and Surgery.
 Chief Clerk of the Bureau of Medicine and Surgery.
 Activities of the Bureau of Medicine and Surgery.

Administration - Personnel (Medical Corps, Nurse Corps and Hospital Corps).
 Dentistry - Physical qualifications - Preventive medicine - Aviation Medicine -
 Material and Finance - Inspections - Planning - Publications - Red Cross and
 Veteran's Administration - Naval Medical Center and Naval Dispensary.

(2). Fleet Medical Organization.

- (a). Under the Surgeon General there is a Fleet Surgeon for the
 ATLANTIC, PACIFIC and ASIATIC Fleet.

Under each Fleet Surgeon are Division Medical Officers who
 in turn have under them individual ships medical officers.
 Medical personnel of ships varies with the size and duties
 of the Ships:-

Type of Ships	No. Med. Off.:	No. Dental Off.:	No. Hospital Corpsmen.
Battleship	2	1	20
Aircraft Carrier	5	2	26
Heavy Cruisers	2	1	10
Light Cruisers	2	1	7
Destroyer (Div. Leader)	1	0	2
Destroyer	0	0	2
Destroyer Tender	2	1	14
Tanker	1	0	3
Supply Ships	1	1	6
Transports	2	1	12
Repair Ships	1	1	6
Submarine Tender	1	1	10
Submarine	0	0	1

(b). Ships above the Destroyer class are equipped to care for
 the general medical and surgical cases with a sick bay capacity varying from
 four to ten beds with added space available for emergencies.

(c). Hospital Ships; Hospital ships are of two classes - True
 Hospital Ships and Hospital Transports. True Hospital ships are designed and
 equipped to operate as floating hospitals while the Transport type is for
 ambulance service only. Complement of an average hospital ship is as follows:
 Medical Officers 16; Dental Officers 3; Pharmacists 2; Nurses 12 and approx-
 imately 125 hospital corpsmen. Such a ship provides medical and surgical ser-
 vice for approximately 400 patients.

(3). Medical activities ashore:

(a). Under the Surgeon General there is a District Medical Officer
 for each Naval District who is responsible for the administration of Naval Hosp-
 itals, Naval Dispensaries, Recruiting Offices and all other medical activities
 in his district.

(b). Naval Hospitals; Average Naval Hospital includes 500 beds.
 The average staff is as follows: Medical Officers 15; Dental Officers 3; Nurses
 18 and 125 Hospital Corpsmen.

(c). Naval Dispensaries: Usually serve Navy yard activities and are usually 5 Medical Officers, 1 or more Dental Officers and approximately 20 Hospital Corpsmen.

(d). Recruiting Stations: 1 Medical Officer, 1 Dental Officer and 5 Hospital Corpsmen.

(e). Navy Medical Personnel Serving Marines in the Field:

(1). The Navy Medical Corps serving Marines in the Field have as their largest medical unit the Brigade Hospital, which may enlarge to as much as 500 beds manned by a Brigade Medical Company and supplemented by medical personnel for the two Regiments forming the Brigade. Each medical company is 66 in number and one Medical Company to each Regiment.

(2). Regimental Aid Stations: Is manned by the Regimental Surgeon, Assistant Regimental Surgeon and approximately 20 enlisted men and when available a Regimental Dental Officer. This is equipped to establish up to a 72 bed hospital.

(3). Battalion Aid Station: Is manned by the Battalion Surgeon, Assistant Battalion Surgeon and approximately 6 enlisted men with 8 enlisted men attached to combat units as first aid men. When available a Battalion Dental Officer is present. A Battalion Aid Station is equipped with medical and surgical chests for emergency care of casualties in the field and is located 300 to 800 yards behind the lines and they evacuate the wounded to the rear. Company aid men (First Aid) are attached to line companies during combat and administer first aid on the line from field pouches. One or more company aid men are present to each 100 men. ~~XXX~~

(4). Collecting Stations: Collecting stations and evacuation procedures are identical with those of the U. S. Army.

2. a. The personnel and material equipment of each medical unit (f. i. Medical Regiments, General Hospitals, First Aid (Battalion) station and medical groups which are attached to various kinds of Corps):

(1). Medical Regiment:

Officers	74
Enlisted Men	986
Ambulances	60
Cars, 5 pass.	2
Motorcycles	19
Trucks & Trailers	117

(2). General Hospital (1,000 Patients):

Officers	73
Nurses	120
Enlisted Men	500
Distillers	8
Physic therapists	8
Seamstresses	2
Ambulances	8
Car, sedan	2
Motorcycle	2
Trucks	12

(3). Battalion Aid Stations:

Officers	2
Enlisted men	27
Blanket set	2
Medical Chest	2
Surgical Chest	1
Lantern set	2
Splint set	2
Water sterilizing set	1
Litters	12
Tent, Wall	1

b. Medical Groups Attached to Corps:

(1). Surgical Hospital (400 Patients):

Officers	50
Nurses	60
Enlisted men	275
Ambulances	2
Trucks	16

(2). Evacuation Hospital (750 Patients):

Officers	47
Nurses	52
Enlisted Men	328
Car, sedan	1
Trucks	7

(3). Convalescent Hospital (3,000 Patients):

Officers	28
Enlisted man	189
Ambulances	4
Cars, sedan	2
Trucks	13

(4). Medical Laboratory:

Officers	11
Enlisted men	45
Cars	1
Motorcycle	3
Trucks	7

(5). Medical Supply Depot, Communication Zone:

Officers	15
Enlisted men	198
Car sedan	1
Trucks	11

3. The ability and duty of each unit:

a. Company aid men: An enlisted man trained in first aid whose duty it is to accompany combatant troops and render first aid on the battle-field.

b. Battalion and regimental medical detachments: Units which accompany battalion and regiments into action, collect wounded from field for transportation to aid stations where they receive first aid and preparation for transportation to the rear.

c. Medical Regiment: The medical force of a division. Duty to collect casualties from battalion and regimental aid stations of line units, transport

then to clearing stations where first definitive surgical care becomes available. This unit must remain mobile to accompany the division to which it belongs. Also medical regiments may be attached to corps and armies to serve same purposes in such units.

d. Surgical Hospitals: To provide definitive surgical care for battle casualties in the zone of communications.

e. Evacuation Hospital: To provide treatment and care for patients in the zone of communications while they await evacuation to the zone of the interior.

f. Convalescent Hospital: To provide medical care and shelter for patients requiring extensive time periods for recovery, usually in the zone of the interior.

g. General Hospitals: To provide definitive medical and surgical care for sick and wounded of all classes.

h. Medical Laboratory Communications Zone: To provide technical assistance necessary to conduct epidemiological investigations to control infectious diseases for corps and division installations.

4. The Medical Service for Air Corps and mechanized units.

a. In general, the medical service rendered the air corps and mechanized units in patterned upon that for other combatant branches, especially when such units are not in combat, the great mobility of such devices as the airplane and the tank as well as the premium upon physical space therein have made it impossible in many instances for medical personnel to be present in planes and tanks engaged in combat. For this reason, special stress is laid upon training of the combatant crews of planes and tanks in first aid and reliance is placed upon radio communication to notify supporting medical elements of the whereabouts of wounded personnel so that they can be more promptly collected and treated.

b. The unit which serves an armored division is the medical battalion composed of:

- (1). A Battalion headquarters.
- (2). A headquarters detachment.
- (3). A collecting company.
- (4). A clearing company.

The organization of the entire medical battalion is as follows:

Officers	25
Enlisted men	333
Ambulances	30
Car, sedan	1
Motorcycle	20
Trucks	47

This is analogous to the medical regiment serving an infantry division and medical tactics are identical with the tactics of the regiment except in the details noted.

c. This office has no available tables of organization for the medical units supporting air corps units.

5. Methods for medical refreshment of the fatigued aviators:**a. These include:**

- (1). Frequent physical examinations by flight surgeons to detect the incipient signs of staleness or disease and the treatment whether as ambulant or hospital cases of instances of disease so detected.
- (2). Provision of high calorie diet rich in vitamins with medical addition of vitamins concentrates where diet is judged inadequate in this respect.
- (3). Frequent periods of general rest and leave from duty.
- (4). Restriction of the number of hours flown by any one aviator in a day inasmuch as it is recognized that prolonged periods of flight bring about marked state of fatigue.
- (5). Insistence upon the use of oxygen supplying equipment while in flight at altitudes in excess of 3,000 meters.
- (6). Abstinence from use of alcohol or alcoholic beverages during and preceding periods of flight.
- (7). Use of foods relatively high in carbohydrate content (Sugars, starches) immediately preceding periods of flight.
- (8). Regulation of hours of duty so as to provide for at least 8 hours sleep in each 24 hour period.

6. The medical service and its organization for defense against chemical warfare.

a. In general, the medical service of a force patterns its defense against gas or chemical warfare upon the same pattern which holds for all units, including combatant units of the force, that is, each medical unit and detachment has its assigned gas officer and gas non-commissioned officer who train the unit in the use of the mask, special clothing and decontamination of equipment, who watch for the use of gas by the hostile force and who give the signal for application of protective devices for the personnel of the medical unit itself. Additionally, medical installations from aid stations to the largest hospitals must treat chemical warfare casualties along recognized medical lines, e. g., supplying oxygen for pulmonary edema, affording complete rest for all gassed cases, neutralizing phosphorus compounds by the application of copper sulfate solution and neutralizing mustard gas by the use of calcium chloride. Medical supply depots normally issue such therapeutic items to all medical echelons. In general, then, medical units are prepared to participate in the defense against chemical warfare in two ways - 1st: Protection of their own personnel in the same ways by which all units are protected, and 2nd, the actual medical treatment of chemical casualties along recognized medical lines. Decontamination of gassed areas is, in general, a function of the separate Chemical Warfare Service.

7. The Medical Service and its organization to prevent infectious disease:

a. In general, responsibility for the enforcement of sanitary measures (Chlorination of water, disposal of sewage, care of mess gear, personal hygiene) are the responsibility of unit commanders of the line. In the supervision of such functions the line unit commander is assisted by his unit medical officer who makes frequent inspections and advisory recommendations upon all such matters to the unit commander.

b. Direct responsibility rests upon the medical service in the matters of - (1) The early diagnosis and separation by quarantine of cases of infectious disease within a command and (2) application of recognized immunization procedures against such diseases as smallpox, typhoid fever, tetanus, yellow fever, cholera.

c. These relationships obtain for units up to the division and there, as well as in corps and army troops, provision is made for a medical officer to act as medical inspector for division, corps, or army forces. This officer has usually had special training as an epidemiologist and he is provided with certain mobile laboratory equipment and enlisted technical personnel which he utilizes upon such trips of inspection or investigation of outbreaks of disease as in his judgement are necessary. The recommendation for corrective measures to be taken against outbreaks of infectious disease are normally made by him, through the unit surgeon to the unit commander who enforces them as he sees fit and often by delegation of authority directly to medical officers.

W. E. COOPER,
Colonel, M. C.,
Surgeon.
