PROGRESS NOTES

Name Gardner, Chas. C. Grade Pvt. Ward 9.

(Complications and changes in diagnosis, with date in each case, should be entered on this sheet)

Admitted in critical condition from E. R. C multiple shrapnel wounds of right chest and right arm. Wounds accurred as a result of a bombardment of Ft. Mills shortly before admission.

Penetrating wounds of chest were cleaned and packed in an attempt to control hemorrhage. Wounds of the arm were debrided and dressed. Traumatic amputation of the right 3rd and 4th fingers were completed.

Patient continues to hemorrhage from chest wounds and shows marked dyspnea. Pulse is weak and thready.

Expired 5 A.M.

PROGRESS NOTES

Name ZBIKOWSKI, Edmond T. Grade Capt. USED Ward Ortho

(Complications and changes in diagnosis, with date in each case, should be entered on this sheet)

March 30,1942

This patient was admitted to the Orthopedic Section, March 24,1942 with a severe shrapnel wound of the left buttock, incomplete fracture of the neck of the femur and shattering of the greater trochanter of the femur also resulted from same wound. Patient under went debridement under spinal anesthesia and was returned to ward in good condition. During the night he became irrational and [illegible]

The Medical Officer attached to [illegible] Battalion, of which Capt. Zbikowski was commanding officer, reveals that for the past [illegible] he has shown signs suggestive of personality changes, from his history, which he has related to the Medical Officer, one gathers that his was an unstable personality prior to entry into the service and that he found it quite difficult to adapt to changing situations. Since arriving on this post it has been noted that he has readily taken offense where none was intended, he is extremely argumentative and can not tolerate ideas that do not conform to his own. His entire personality picture is that of a Schizoid.

During his period of hospitalization he has been uncooperative and irrational continually, screaming and cursing at intervals and has shown a definite tendency to catatonic phases.

Thomas H. Hewlett
Capt. Med. Corps.

arch 31,194
Condition critical, patient developing pulmonary edema, has not taken any nourishment for nearly forty eight hours, tube feeding attempted without success, temperature gradually rising to higher levels, [illegible] developed a bilateral bronchopneumonia.
Thomas H. Hewlett
Capt. Med. Corps.

April 1, 1942
Condition endangered, patient [illegible] seriously ill.
T.H.H.

Grade CQM Ca. — W/O 2 51 Regt. and Arm or Service USS Navy
Age 32 Race [illegible] Nativity [illegible]
Service [illegible] Date of admission Dec. 27, 1941 @ 11:00 AM
Source of admission Par 6 b (5) AR 70-010
Station Fort Mills, P.I.
Ward Orthopedic
Religion [illegible] Home address [illegible]
Name and address of nearest relative [illegible] T.H
(Relation of relative above)

Disposition Died Date 10:45 pm Oct 23, 1942

Final diagnosis: Patient sustained a fracture, dislocation of the spine at about the level of the 10th dorsal vertebra with immediate paraplegia when a bulkhead fell on him during an explosion that resulted from a bomb dropped by an enemy plane on Dec 24/41. He was sitting down and when the explosion occurred he was pitched forward on the deck and was never able to alter his position.

Additional diagnoses (Complications, special treatment and operations):
Bilateral pneumonia, hypostatic 12/27/41.

Line of duty Yes
Condition on completion of case DD
Transfer diagnosis confirmed or not confirmed
Autopsy No

See Consent Record for final entry.
Expired 2:30 pm
Next of kin notified

JSD NO. 15 Book Chit ISSN Ward 2
Name MARTIN, E.C. Female (Name-Grade-Ser. No.)
Part to be examined (or treated) Entire system, dorsal spine
Clinical diagnosis (Include operation) Fracture, spine, dorsal, 10th
Date 12-27-42 19 Ser. No. 207-03-38 Rank or Grade CQM USN M.C.

Roentgenological Report No. 1
Date 12-27-42 19
Roentgenological X-ray investigation of the spine shows a fracture of approximately the 10th dorsal vertebra with a dislocation forward of the upper portion of the body of the vertebra. There is an associated compression fracture with separation of the bony elements of the vertebrae with marked displacement forward of the upper portion of the body of the vertebra. There is posterior tilting of the posterior fragments.

PROGRESS NOTES

Name Harbin, Earl C. Grade CMM USN Ward 7

(Complications and changes in diagnosis, with date in each case, should be entered on this sheet)

10/20/41 Resting comfortably - J.H.H.

11/7/42 Urine clear. Microscopic clear, patient complains of the area of pain over 1st lumbar vertebrae - paralysis complete. J.H.Hewlett

2/6/42 Little variation in general condition. J.H.Hewlett

2/14/42 Area marked by decubitus ulcer gradually increasing in size unfavorable in therapeutic measures. No return of sensation or motion - Hewlett

3/10/42 no change in general condition J.H.H.

3/29/42 Patient plays up & entertains responding to Sulfanilamide J.H.Hewlett

4/20/42 Little variation during past month, exudation due to atrophy & lower extremities becoming involved J.H.Hewlett

5/4/42 condition unchanged.

5/15/42 Unchanged. Hewlett

(Use both sides of this sheet)

THE BILIBID HOSPITAL
FOR MILITARY PRISON CAMPS OF P. I.

August 9, 1944.

REPORT OF AUTOPSY IN CASE OF HAWKINS, Walter Christopher, Cpl., U.S. Army, Div. 1580, August 9, 1944. Autopsy performed 1400, August 9, 1944.

The body is that of an emaciated white male, 30 years of age. The estimated weight of body is 100 pounds, the estimated height 70 inches. There is a decubitus ulcer 5 cm. in diameter over the sacrum. There is no rigidity or edema present. There is a sub-icteric tinge to skins. The right pupil measures 1 cm. in diameter. The left pupil 6 mm. The body is devoid of subcutaneous fat.

On opening the abdomen there are flecks of fibrin scattered over the liver and in the pelvis. The omentum is adherent to the spleen. The epiploic foramen is open. The inguinal rings are present. The diaphragm arch recedes to the 5th rib on both sides. There is no free fluid present.

On opening the thorax, there is no fluid present on either side. There are no adhesions. On opening the pericardium, there is 120 c.c. of pale yellow fluid and fibrin.

THE HEART appears pale. Its estimated weight is 370 grams. The pericardium is normal. The walls and septum are fibrous, Myocardium brown. The mitral valve is thickened and congested. Attached to the posterior valve, there is a large vegetation measuring 3 cm. in diameter. It is pinkish grey and friable, irregular in shape and calcified at the base. There are streaks of recent thrombi on the outer surface. The aortic valve is shortened and thickened. The other valves appear normal. The aorta shows atheromatous sclerosis with calcification grade 2. The coronary arteries show sclerosis grade 2.

LUNGS - Both lower lobes show early consolidated areas measuring 2 cm. in diameter and there is one recent abscess in the center of the right lower lobe measuring 3 cm. in diameter.

LIVER - Estimated weight 1500 grams. The capsule is slightly thickened and covered with flecks of fibrin. The capsule cuts with increased resistance, grade 1. The cut surface appears normal.

GALL BLADDER - Contains 10 c.c. black bile. It appears grossly normal.

SPLEEN - Its estimated weight is 350 grams. The hilus is completely covered with fibrin. The hilar artery is replaced by pinkish grey fibrous tissue which projects 1 cm. above the surface. It measures 4 cm. in diameter by 4 cm. thick. Other areas are reddish grey and of softer consistency.

THE KIDNEYS [illegible] appears grossly normal.

THE PANCREAS [illegible] grossly normal.

THE ADRENALS appear grossly normal.

THE BILIBID HOSPITAL
FOR MILITARY PRISON CAMPS OF P.I.

November 13, 1944.

MEMORANDUM:

SUBJECT: INFORMATION FOR TRANSPORTATION REPORT.

TO : ALL WARD SURGEONS, MEDICAL OFFICER BUILDING 18, AND ATTENDING SURGEON BUILDING 7.

It is requested that a classification of all individuals in your Ward or Building, in the following categories, be submitted to the Personnel Office on November 15, 1944, together with the Night Report. Submit numbers only, names are not necessary.

(a) Litter patients.
(b) Riding patients.
(c) Walk without baggage.
(d) Walk with baggage.

This report pertains to sick in hospital patients, sick in Quarters patients, wall cripples and well personnel. All well personnel should come under the "walk with baggage" category.

Admissions and discharges that take place prior to the time the evening report is submitted, will be carefully checked to ascertain that all such changes are shown.

JAMES O. HEIDS,
Captain, M.C., U.S. Army.
Adjutant.

Please initial:

Gable, Jesse J. Cpl. 4/20/42.

Patient received traumatic amputation of the left leg at the knee and a comp. comminuted fracture of the upper right tibia from large shell fragments during an enemy bombardment of Ft. Mills Corregidor before admission. His condition is critical.

A guillotine amputation of the left leg at mid thigh was done but the open wound of the right leg was debrided, cleaned and covered in the O.R., then placed in a Cabot splint. His condition has improved but slightly since surgery. To have another transfusion this P.M.

Nelson

4/21/42. Patient very restless this P.M. Pulse is rapid and strong. He appears febrile.

Nelson

4/22/42. Patient definitely worse. Temp. very restless this A.M. Pulse is respirations are the marked aspect of the chart, the fever and unrest is uncertain and the cause is circumstantial of gas infection. A multiple stimuli.

Nelson

5/1/42. Aboard the same this A.M. & like today's this restless. Patient became quiet and is now sleeping after 40,000 U of antitoxin in 1000 cc N. saline IV.

Recruit, Eulalio, Serial No. 1st. 4th Marines.

History: [illegible] 4/14/42 During the enemy shelling of this post the patient was struck in the jaw by a fragment of shell. There was no loss of consciousness.

Past History; Essentially Negative.
Examination; No abnormal findings.
Special examination; The central portion of the mandible and lip are missing. The suprahyoid muscles partially missing and fragments of the mandible in the cavity left by the missing muscles. The central incisors are missing. The floor of the mouth and the mucosae of the tongue is split in the midline deeply into the muscle tissue.

Operation; Closure of the muscle planes with Chromic 0 suture and lower portion of the tissues of the tongue. The ends of the mandible were covered with mucosa, and wired to the maxillae. The lower lip was repaired plastically and a drain was inserted in the lower angle of the wound.
Anes; 1% Procaine infiltration. Operator; Maj. Hagen
Asst. Maj. Richardson.
Tetanus Toxoid; 1cc.

4/15/42 Dressing. Coad. Speech is good. Swallowing without difficulty. No respiratory difficulty. [illegible]

4/17/42 Some bleeding from stab drains. Rubber drains and clots removed. Packed & Iodoform gauze. No further bleeding. [illegible]

4/17/42 10 PM Patient is said to have got out of bed and was delirious. Nurse states that there was no temperature.

35

5-22-42 Temperature still high, cough and pain in chest persistent. Many subcrepitant rales are heard in the bases of both lungs. This may be a bronchopneumonia. Sulfapyridine started today.

5-25-42 Patient unco-operative, refuses to take medicine and does for himself. He is incontinent both of bowels and urine. Seems to have retired mentally within himself. Do most probably uncheerful.

5-26-42 Mental status about same. No improvement seen. Patient a difficult nursing problem. To be transferred for further care.

5-28-42 General condition much improved. He is still quite a nursing problem, but temperature very well. He is swiftly a lonely old man who is puzzled by his situation.

6/2 Course downhill - pt. is seriously ill & - afebrile

Moribund

6/3/42 Patient pronounced dead by me at 7:45 PM

PROGRESS NOTES

Name Summers, Jessie Grade Pvt 760TH Ward 6

(Complications and changes in diagnosis, with date in each case, should be entered on this sheet)

Pt. admitted Infirmary in Division, since marked ill nights, for about 2 weeks. About one week ago while in ground, he fell off a [illegible], about 15 feet & struck the head + the R. parietal region. He was dazed, but not rendered unconscious. Since then he has had occasional headache in that region.

Past history: Mumps, only childhood illness recalled. Vaccination 2 years 3 months ago - no sick take off & pain. Tuberculin 3 months ago for about 3 months, he made swelling.

Entry: Pale, well developed man aided boy of 19. Not acutely ill. Uremic odor + breath.

Head - no evidence of trauma.

Eyes: pupils equal + react to light. Eyes normal.

Fundi - bilateral papilledema of two degrees, + marked tortuosity of arteries. Marked thinning of retina. No hemorrhages + exudates seen. (Pupils not dilated - Urea)

Vision OD 20/30; OS 20/20-2.

Ears, Nose + Throat normal. Mouth normal.

Neck - no abnormal nodes.

Chest - well formed. Resp. Sys. - clear.

Heart - noticeably enlarged, apex 1" to left of nipple in 5th ICS.

Blood sounds muffled, Rhythm normal - no apex

P2 > P1 and accentuated. Rate 82/min. Rhythm regular.

Abdomen normal.

Pelvis - normal. No edema.

Nerves - normal power, coordination, reflexes + sensation.

Skin - few shallow ulcerated abscess on right arm.

Diagnosis: 1. Uremia, due to Chronic Glomerulonephritis

2. Hypertensive Heart disease, compensated.

3. Nephritis Retinopathy.

4. Secondary Anemia, due to C.

(Use both sides of this sheet)

Emil Horn
Capt. MC

PROGRESS NOTES—Continued

2/15/42 Ophthalmological consultation

Fundi - media - clear

Disc margins hazy especially nasal on R.

Retinal edema as manifested by absence of vessel stamp. Vessels found below disc.

Veins: arteries :: 2:1

(No A-V compressions)

tortuosity; marked peripheral capillary

[illegible] neuro-retinopathy secondary to renal lesion

W. A. Wilson
Capt. MC

2/18/42. Pt. feels much improved since admn. Temp. normal. Fundi - some subsidence of papilledema esp. at left. BP 132/92. Uremia is probably acute nephritis within three months. Hematuria gone. Edema gone.

2/19. Urine shows continued improvement.

2/23. Pt. has recurrence of headaches in past 2 days + complains of a cold.

Exam. Nose - nasal mucosa reddened & pt. mucoid secretion in pharynx middle meatus on Right.

Nasopharynx - small adenoidal mass, not grossly inflamed.

Pharynx - small buried tonsils, not grossly inflamed.

Tracheobronchial - clear small fremitus, clear auscultation.

PROGRESS NOTES

Name Paul, Frederic E. Grade Pvt. Ward 9

(Complications and changes in diagnosis, with date in each case, should be entered on this sheet)

Patient admitted directly from E.R. in critical condition.

He has multiple shrapnel wounds of both legs resulting in comp. comm. fractures of the legs and a wound of the RLQ of the abdomen from which several inches of intestines protruded. These have been replaced. He was wounded shortly before admission during a bombardment of 81 m.m. Mills.

Patient was given 1000 cc IV fluids and he responded sufficiently to be taken to surgery. He expired on the table while repairing intestinal perforations.

Edwin R. Nelson

4-26-42

Soldier was brought from Ft. Frank in a stuporous condition suggestive of skull fracture Spinal puncture revealed increase cerebrospinal pressure with markedly bloody fluid and due to cerebral hemorrhage. Withdrawal of 10 c.c. relieved his pressure and stupor. This was often and soon again followed by signs of increase intracranial pressure, and sterterous breathing and finally died, at
